57 <b>La</b> Lanthanum	58 <b>Ce</b> Cerium	59 <b>Pr</b> Praseodymium	60 <b>Nd</b> Neodymium	61 <b>Pm</b> Promethium	62 <b>Sm</b> Samarium	63 <b>Eu</b> Europium	64 <b>Gd</b> Gadolinium	65 <b>Tb</b> Terbium	66 <b>Dy</b> Dysprosium	67 <b>Ho</b> Holmium	68 <b>Er</b> Erbium	69 <b>Tm</b> Thulium	70 <b>Yb</b> Ytterbium	71 <b>Lu</b> Lutetium
89 <b>Ac</b> Actinium	90 <b>Th</b> Thorium	91 <b>Pa</b> Protactinium	92 <b>U</b> Uranium	93 <b>Np</b> Neptunium	94 <b>Pu</b> Plutonium	95 <b>Am</b> Americium	96 <b>Cm</b> Curium	97 <b>Bk</b> Berkelium	98 <b>Cf</b> Californium	99 <b>Es</b> Einsteinium	100 <b>Fm</b> Fermium	101 <b>Md</b> Mendelevium	102 <b>No</b> Nobelium	103 <b>Lr</b> Lawrencium

- Alkali Metal
- Alkaline Earth
- Transition Metal
- Basic Metal
- Metalloid
- Nonmetal
- Halogen
- Noble Gas
- Lanthanide
- Actinide

# Electrons in the orbitals

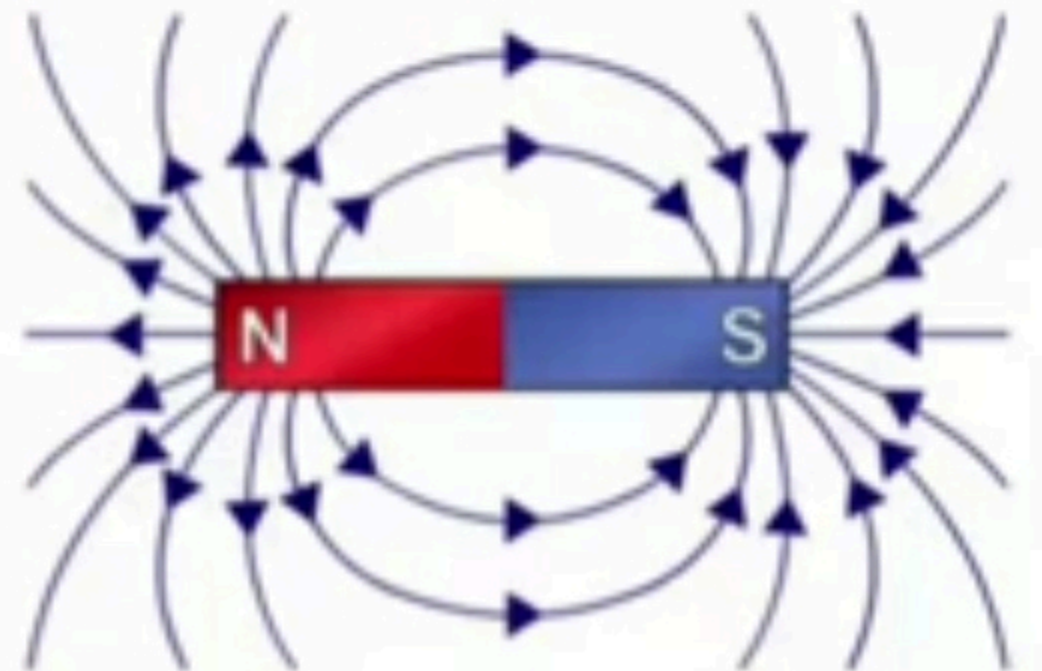

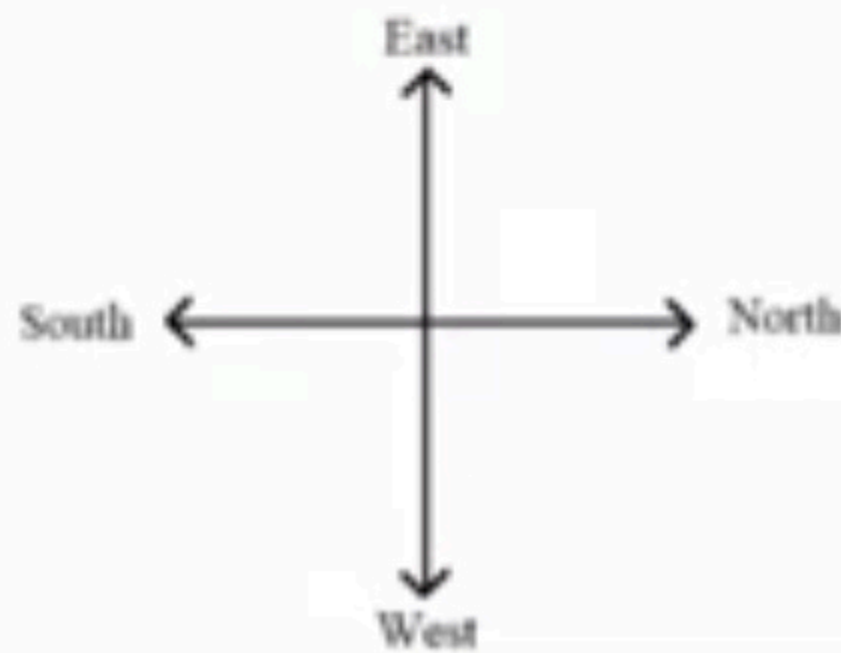

# What is Magnet ?

*A magnet is a material or artificial setup that can produce its own field called magnetic field by which it attract ferromagnetic materials like iron, cobalt or nickel.*

- Magnets, suspended through a string, always point towards the north-south direction.*
- A magnet always comes with a pair of magnetic poles, which cannot be seperated.*

# Ferromagnetic

- Any material that possess magnetization **WITHOUT** an external magnetic field is ferromagnetic
- large and positive susceptibility
- Examples of ferromagnetic materials

Iron (Fe)

Susceptibility = 200

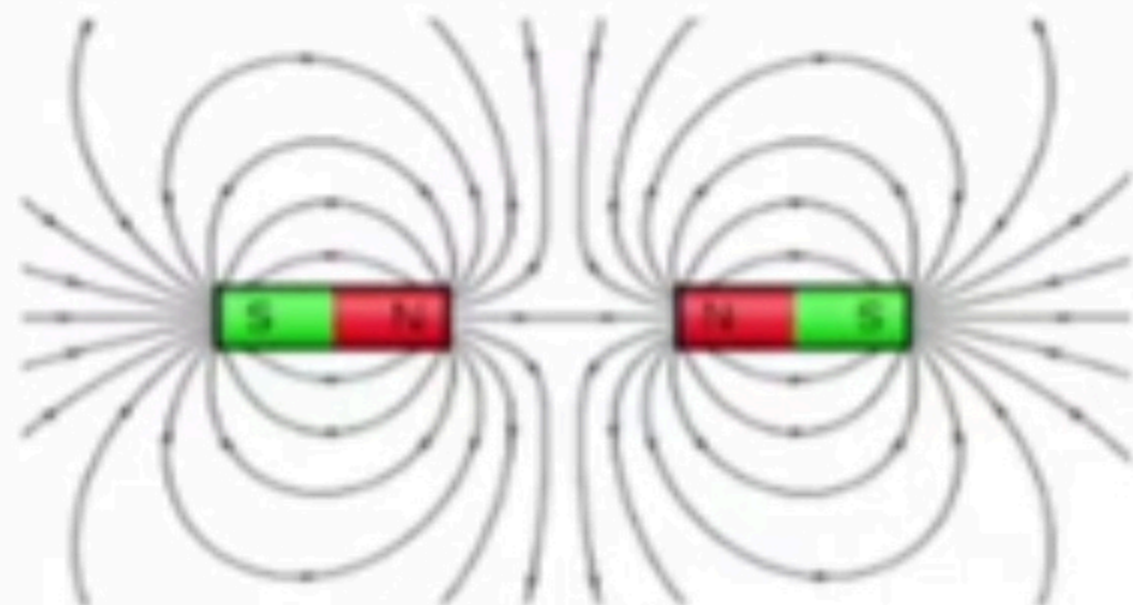

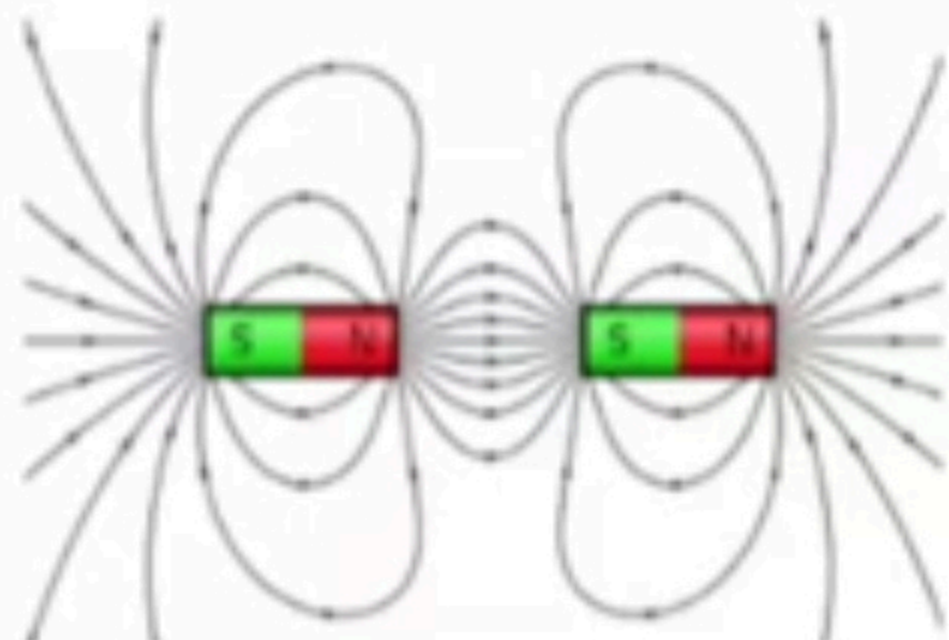

Cobalt (Co)

Susceptibility = 70

4. *Maximum force at poles and zero at middle.*
5. *When a magnet is broken into two parts then each part becomes a magnet with north and south pole that mean magnetic poles always exist in pairs.*
6. *Magnet produce its own magnetic field in which other magnet experiences magnetic force which can be repulsive or attractive.*

## Magnetic Field & Lines of force

- *The space around a magnetic pole in which another pole feel a force is called the magnetic field.*
- *Magnetic field can be visualized by magnetic lines of forces, which are imaginary lines.*
- *A line of force can be defined as the path taken by an independent north pole moving from the north pole of magnet to the south pole.*

## The Line of Force have the following properties:-

- They are imaginary lines.
- Starts at north pole and ends at the south pole.
- Two lines of force never cross each other.
- The lines of force are greater near the poles.
- Can never be closed loop.

# Magnetic Flux & Flux Density

- *The total number of lines of force used to express pole strength is called the magnetic flux.*
- *Unit is weber (Wb).*
  
- *The term magnetic flux density (B) is defined as the magnetic flux per unit area.*
- *Unit is  $Wb\,m^{-2}$ .*
- *SI unit of magnetic flux density is Tesla (T)*
- *CGS unit is Gauss (G)*
- *1 Tesla (1T) = 10,000 Gauss.*
- *One Tesla =  $1Wb\,m^{-2}$ .*
- *The magnets used in MRI is in the range of 0.3-3 Tesla*

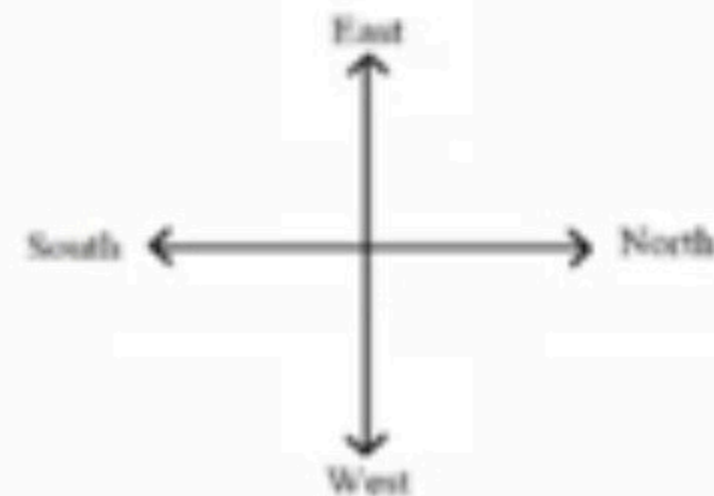

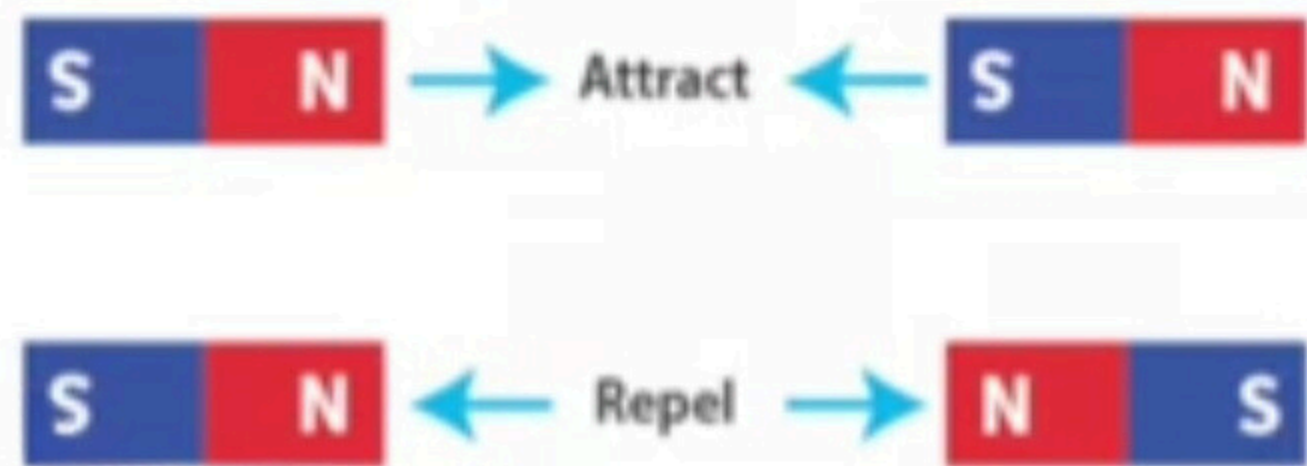

# What is Magnetism ?

- *Magnetism: A magnet produce its own magnetic field by which it attract other magnet or iron-filling or iron substances, **this property of attraction of magnet is called magnetism.***
- *This magnetic property is due to the **motion of charged particles.***
- *As we know atom consist of positive charged nucleus & negatively charged electrons.*
- *These electrons circulate around the nucleus own orbit called **orbital angular momentum** & spin around own axis called **spin angular momentum** both the orbital and spin angular momentum form **a tiny current loop** which is turned **produced magnetism.***

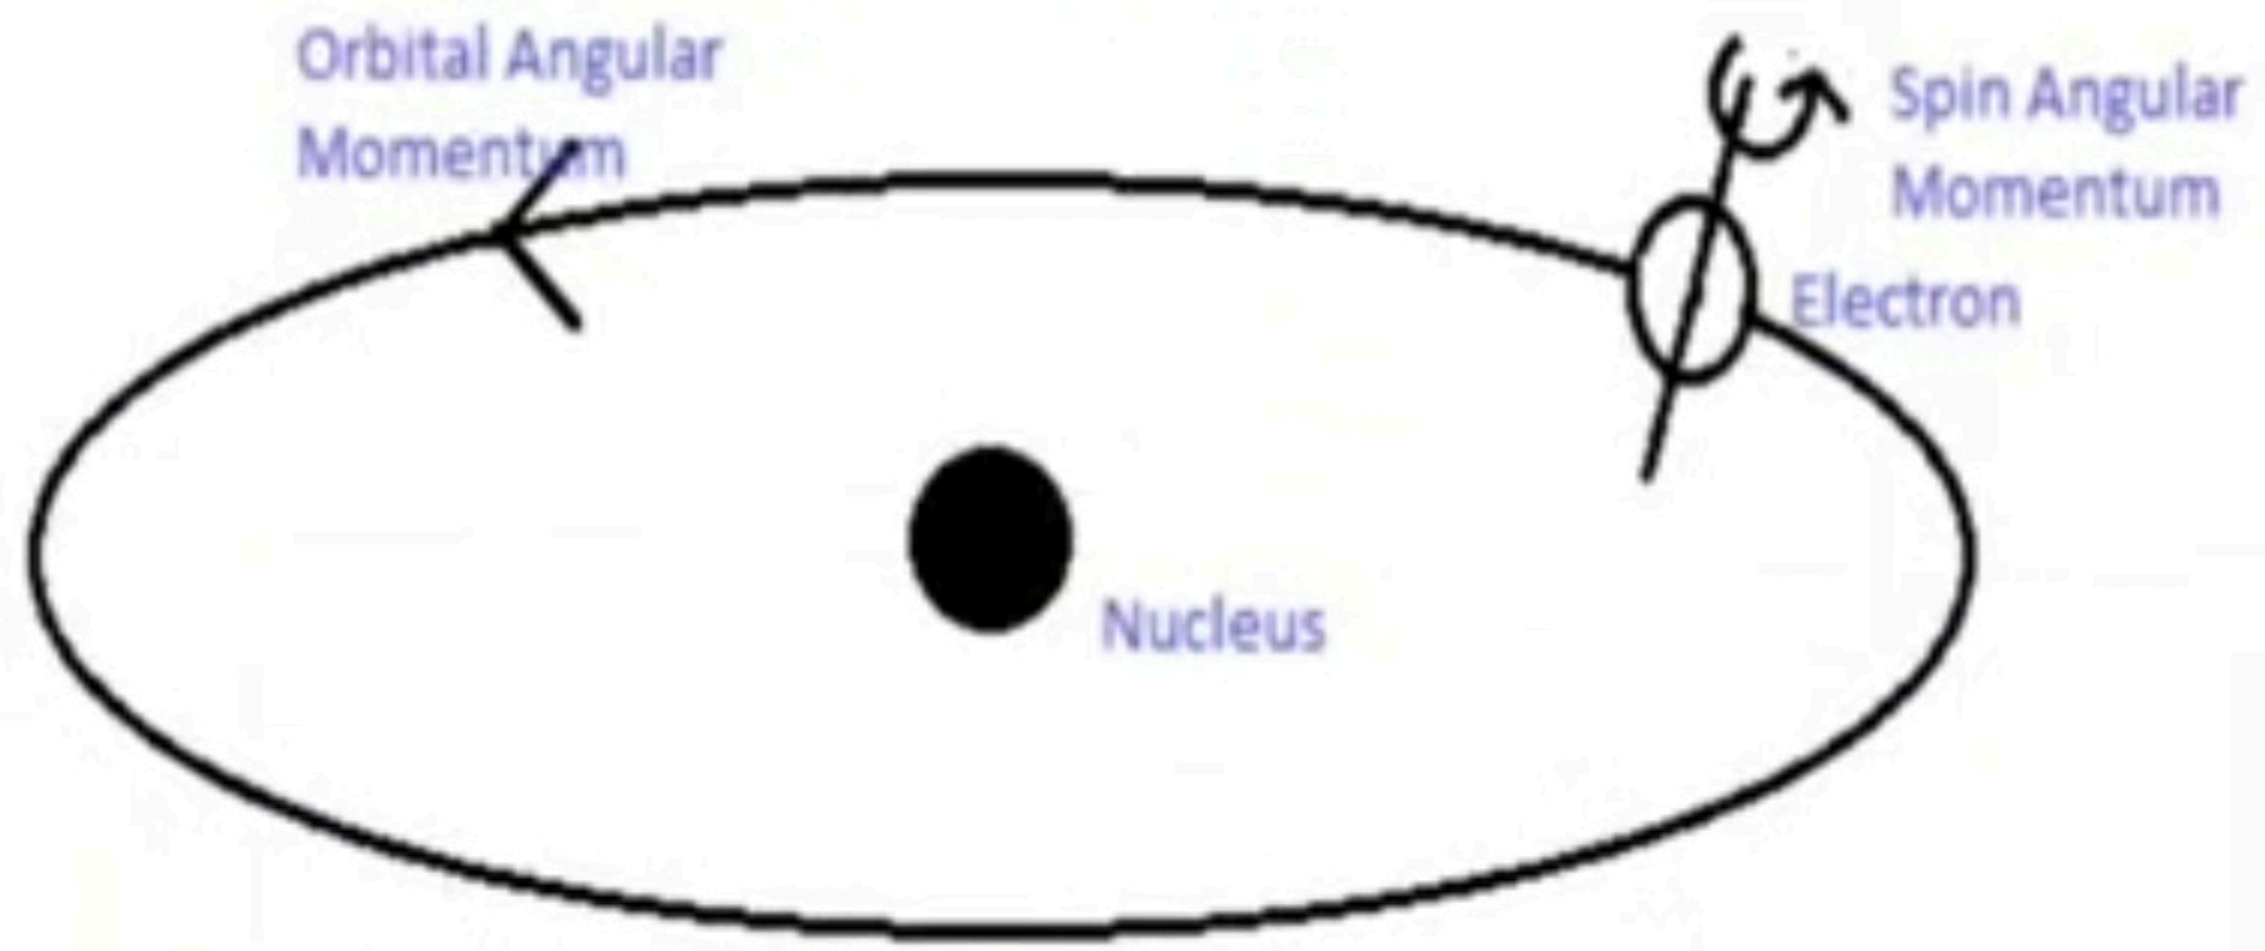

# Properties of Magnet

- 1. Attractive property :- Magnet attracts ferromagnetic materials like - iron, cobalt and nickel.*
- 2. Repulsive property:- Like magnetic poles repel each other and unlike magnetic poles attract each other.*
- 3. Directive property:- A freely suspended magnet always points in north-south direction.*

*Tiny Bar Magnet*

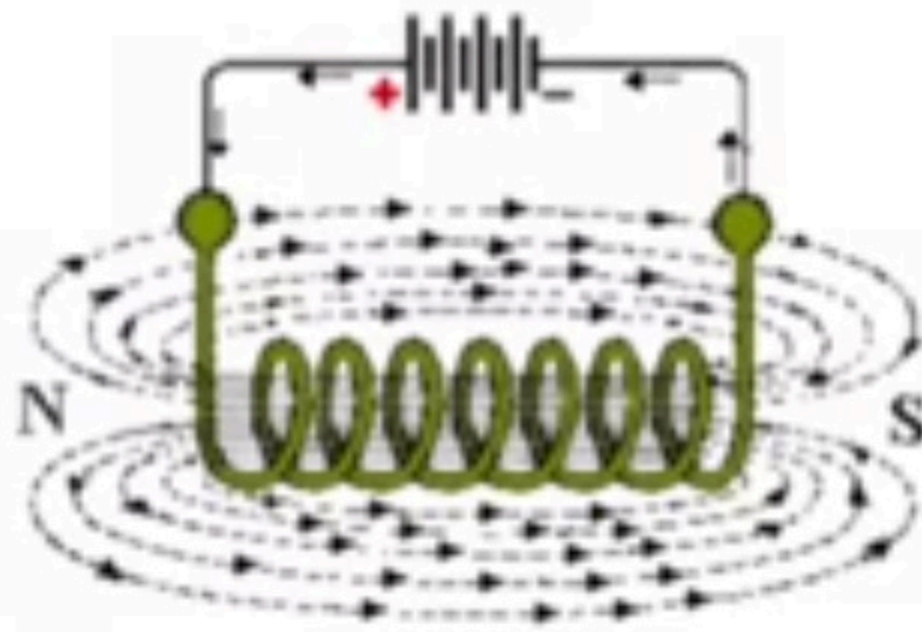

# Types of Magnet

A). Natural Magnet :- Only Permanent

B). Artificial Magnet :- 1. Permanent

2. Temporary :- i) Electromagnet

ii) Superconducting Magnet

## A). Natural Magnet

- *Natural magnets are magnets that found in nature.*
- *Natural magnets are minerals or metals that generate a stable magnetic field without artificial inducement.*
- *All natural magnets are permanent.*
- *Example:- Lodestone(Magnetite) :-  $Fe_3SO_4$*

## *B). Artificial Magnet*

- Magnet that are made artificially by the human by using different techniques or by inducing external source of energy is called artificial magnet.*
- These magnets are magnetized piece of iron, nickel or cobalt by the external source of energy.*
- They are stronger as compare to natural magnet.*
- They can be permanent or temporary.*

## a). Permanent Artificial Magnet

- *Permanent magnet do not loss their magnetic property once they are magnetized (Induced by external source of energy).*
- *Ex :- Neodymium Magnet like - Bar magnet, Cylindrical magnet, Circular magnet, Horse shoe magnet.*

## *b). Temporary Artificial Magnet*

- *Made by the soft metals that are magnetized by the permanent Magnetic Field or electric current.*
- *After remove from the permanent magnetic field or electric current they behave like a soft metal.*
- *Ex :- 1. Electromagnet*  
*2. Superconducting magnet*

# Electromagnet

- *An electromagnet is a type of temporary magnet in which the magnetic field is produced by an electric current.*
- *Electromagnets usually consist of wire wound into a coil.*
- *The wire turns are often wound around a magnetic core made from a ferromagnetic or ferromagnetic material such as iron or nickel.*
- *A current pass through the wire creates a magnetic field in the coil, and coil behave like A magnet.*
- *The magnetic field disappears when the current is turned off.*

# Superconducting Magnet

- *A superconducting magnet is an electromagnet made from coils of superconducting wire.*
- *They must be cooled to cryogenic temperatures during operation.*
- *In its superconducting state the wire has no electrical resistance and therefore can conduct much larger electric currents than ordinary wire, creating intense magnetic fields.*
- *Liquid helium is used as a coolant for many superconductive windings. It has a boiling point of 4.2 K, far below the critical temperature of most winding materials.*
- *The magnet and coolant are contained in a thermally insulated container (dewar) called a cryostat.*
- *Use :- In MRI*

# What is Electromagnetism ?

- *Electromagnetism is the branch of physics that studies the behaviour and interactions of electric and magnetic fields.*
- *Electromagnetism is the force that gives rise to electric fields and magnetic fields, with the electric field exerting a force on charged particles, and the magnetic field exerting a force on moving charges.*
- *Electric fields are caused by electric charges, while magnetic fields are caused by moving electric charges.*
- *Applications of Electromagnetism :-*
  1. *Electric motors and generators*
  2. *Electric power transmission*
  3. *Electromagnets in MRI etc.*
